### 3. Title of thesaurus (or URL):

ERIC (https://eric.ed.gov/?qt=Blended+learning&ti=Blended+Learning)

### 4. Name of index/database:

Child Care and Early Education Research Connections

### 5. Producer:

ICF and the Office of Planning, Research, and Evaluation at the Administration for Children and Families, U.S. Department of Health and Human Services

### 6. Years covered:

1919 (oldest article with a date attached) to present. Database launched in 2004.

# 7. Would you recommend this database to a client who is working on your topic?

No, I would not recommend this database to a client who is working on my topic because it does not contain a lot of resources on this specific topic. There are several sources that I was able to find that were about the topic or closely related enough that might be helpful. Other than the lack of informative resources on the topic, the database was easy to use. There was a search bar and options to filter the searches even further, such as selecting the publication date, the type of resource, or if the source was peer-reviewed. The search results screen was also helpful. The screen had the results listed, and each listing consisted of the title (linked to more information about the article), authors, type of resources, and a sneak peek of the summary; this allowed you to get a better idea of what the article was going to be about.

### 3. Title of thesaurus (or URL):

ERIC (https://eric.ed.gov/?qt=Blended+learning&ti=Blended+Learning)

# 4. Name of index/database:

APA PsycINFO

# 5. Producer:

# American Psychological Association

### 6. Years covered:

Citations and summaries as far back as the 1600s. Journal coverage from the 1800s to present. Database launched in 1967.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. A lot of resources about this topic appeared in the search results by simply typing in "blended learning," so that is promising. This database also gives the user the option to filter their search using the filters on the left side of the screen, or the option to perform an advanced search with a variety of choices that will help narrow down your search. Several examples of these choices are publication date/year, publication status, age groups, document type, and supplemental materials. Also, the search results screen is easy for a user to follow. Each result shows the title (linked to the article), an icon that shows the type of source, authors, and subjects. Highlighting the subjects gives the user a snapshot of what will be covered in the article. On the side of the search results, as I mentioned earlier, there are filter options that are broken up into sections that a user and read through and select the desired filters.

### $\hfill \square$ 1. Administrator and teacher perceptions of effective blended learning in a K-12 setting.

Allison, Nicholas M.; Dissertation Abstracts International Section A: Humanities and Social Sciences, Vol 84(3-A) Publisher: ProQuest Information & Learning; [Dissertation], Database: APA Psycinfo Subjects: Academic Achievement; Demographic Characteristics; Student Attitudes; Teacher Attitudes; Blended Learning; Adulthood (18 yrs & older)

## 4. Name of index/database:

National Council of Teachers of English (NCTE)

### 5. Producer:

The National Council of Teachers of English

Unknown, but the articles in my search results cover 2002 to present. Looks like the NCTE website was launched in 1998.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic because there are plenty of sources available. Although many sources related to the topic can be found in this database, the search function is not the best. It allows you to narrow down what it searches from; the choices are the entire site, NCTE, CCCC, ReadWriteThink, Store, and Journals. Also, the search bar allowed for Boolean operators but there were no other filtering options available. I found that "Journals" gave me the best sources that related to my topic. These sources that I found are what I screenshot for #8 below. This database did not have an option to bookmark or save items on a separate list, which was inconvenient.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. The first reason I would recommend this database is because there appears to be many resources available about the topic that can be searched through and filtered down to the patrons more specific needs if needed. The filters available on this tool are amazing. Types of filters available include content type, disciple, publication date, subject terms, language, and the option to refine your search to include sources that have full text online, are peer-reviewed, are scholarly and peer-reviewed and are from the libraries catalog. Boolean operators were also able to be used in this search bar. I was able to find a few sources, which are highlighted in #8, by trying a few different filtered searches. Along with using the filters, I also tried substituting my base word with some of my own search terms and thesaurus search terms. All in all, I would recommend this database because it has plenty of sources on the topic, and the filters are very useful when a reader needs to find more relevant sources to their topic, find sources in a certain date range, etc.

7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. The database interface looks like it is out-of-date even though the sources it contains can be as recent as this year. The search filters in this database are quite useful. The filter that I found the most important is the ability to limit availability to subscriptions held by my library. I have not seen this option yet available in other databases yet. It is always the worst when you find a journal article you are interested in and discover that you cannot access it. The other filter options included Boolean operators, year, language, document type, peer-reviewed, limit to full text, and rank by relevance or date. This database allows you to find reliable and recent sources dealing with the topic that are actually available in your library, so I would definitely recommend.

## 4. Name of index/database:

LearnTechLib: The Learning and Technology Library

### 5. Producer:

Association for the Advancement of Computing in Education

Exact years are not list. States that it covers "30+ years" of a variety of sources. My search results cover 2001 to present.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic because the search results contain many resources that are related to the topic. The filters available are great; they include full-text or abstract-only sources, publication date, authors, record type, language, and topics. I think the "authors" filter is an interesting filter to have since it does not seem to appear often in databases. This filter lists 10 authors that have the most articles or papers within the current search parameters. Another fascinating feature that this database has that may be helpful while searching for materials is the sort by feature. The reason I find this feature fascinating in this database compared to other is that it has four options of how to sort when it is normally two: relevance and date. The four sort by options available in this database are relevance, date, popularity, and publication. I tried each sort by option and checked each list; they definitely changed how they were sorted between each option. The sort by options are another way to find sources or even look for sources from a different point-of-view. The only reason I might not recommend this database is it had loading issues once you logged into an account in order to save a list of sources. No matter what day I tried or what browser I used, I ran into these loading issues. Once you logged into an account the website that the database is on basically stops letting you search terms. This might not happen to all users, but I would warn the person I am recommending this database to.

### 5. Producer:

NewsBank Inc.

Unknown, but the articles in my search results cover 1986 to present.

7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. This is not a database that one would automatically think to check for this topic since it is a news database, but it does provide 13,494 results for "blended learning," 1,745 results for "flipped classrooms," and 25, 418 results for "hybrid learning." In these thousands of results available, many articles involve news about examples of schools that have used the blended learning model and how blended learning affects the school, the teachers, and the students. The numbers of results above are before filtering was done. The number of results will become less intimidating to a patron once they apply filters to the results, which will make them more manageable. The filters provided can be helpful. They include sort by, date selector, date search, source type, year, source name, source location, and language. A cool feature that is present in this database is each search result has a "Preview" button that leads to a pop-up of the first paragraph or two of the articles, which allows the reader to get a better idea of what the article will be about. All in all, I would recommend this database.

### 5. Producer:

William S. Hein & Co.

Unknown. My search results include articles as far back as 1836. However, based on <u>an article</u> on HeinOnline about the government documents that it hosts in its library, the years covered are at least 1754 to present.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. Of course, this database would not be my first recommendation since this database is dedicated to law journals and legal documents, so it would not be guaranteed that a patron would find articles related to my topic. I was curious if a case or a law had been created that involved the topic, so I attempted a search of this topic in this database. Fortunately, although I did not find a law or case related to "blended learning," I found many articles about blended learning in law schools. After this discovery, I would definitely recommend this database since it has articles about blended learning in relation to a specific field of study, which might be helpful if they decide to compare and contrast how different fields use blended learning or simply want to point out that it can be used in specific field of study. Aside from having plenty of sources, I believe that the filters available are quite satisfactory. These filters include date, collection/library, pathfinder subjects, section type, location, title, organization, person, and availability (full text or indexed). The sort by options are also useful for searching and finding articles. These include relevance, oldest first, newest first, number of times cited by articles, number of times accessed (past 12 months), and most cited authors. Several of these sort by options are unique, but quite helpful, since they can help the patron discover how reliable or useful an article is based on how many times it was cited by other articles or accessed.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. It is an index with millions of academic and research papers from many different publications, so the articles found will be from a multitude of different sources. The search filters and other features may not be as extensive as some of the other databases that I have explored so far but they are still sufficient and useful. The search filters include release date, resource type, availability, and sort order. One other feature that may be helpful to someone searching for articles on this database is that it provides two ways to find the source: a pdf of the source from the Web Archive using the WayBack Machine or a link to the publisher's website/the DOI. This database also provides a button to help the person searching for articles cite the article, which is a skill that some may struggle to do. Sadly, this database does not have an option to save or bookmark articles into a list to view later, which is one negative of using this database. (For #8, I took a screenshot of the top 5 results that I found the most useful in a filtered search that narrowed my search down to the most relevant papers, available in full text, released in the past year.)

## 7. Would you recommend this database to a client who is working on your topic?

No, I would not recommend this database to a client who is working on my topic. This database is mainly designed for faculty and students of higher education, and it shows in the features of the database. For instance, in the filters provided (discipline, material type, audience, mobile platform), the options available to select are geared towards teachers and others in that field. An example of this can be seen by looking at the material type filter, some of the options to select from include assignment, workshop and training, development tool, and drill and practice. From the given options of materials to select from, someone that is not in the field of education searching for information on this topic would likely find the journal articles the most helpful. This brings me to the second point of why I would not recommend this database to a client who is working on my topic: a search on blending learning, including journal articles only, shows only 21 search results. I feel that this database does not give many options of sources that someone working on this topic can select from.

## 4. Name of index/database:

JAMA Network

# 5. Producer:

American Medical Association

#### 6. Years covered:

1883 to present.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. The first reason I would recommend this database is it is produced by the American Medical Association and includes articles published in one of the Journal of American Medical Association publications, so the article will be reliable. Another reason I would recommend this database is the search filters are quite useful. The filters in this database are publication, collection, article type, topics,

content type, data range, and other filters (i.e., Free, Online Only, Has Multimedia). These filters, especially topics and collection, can help the client narrow the search to find results that are closer to their desired topic within this broad topic of "birth control." For instance, if the client was interested in learning about teens/young adult reproductive health in the last ten years, then they would select "adolescent" as a topic and select a date range of 2013 to 2023. All in all, I would recommend this database because it contains a lot of reliable sources and helpful search features.

8. Insert here the screen capture from the database that includes bibliographic citations of relevant articles. I do not need the full text of the article! Place a page break after each search/finding. After the page break, please start the new database evaluation with number 1.

(This database does not have the ability to bookmark and save articles to a list to view later or cite, so the picture below shows the top 5 results of a filtered search of most relevant articles in the last three years under the topic of contraceptive methods.)

## 4. Name of index/database:

AccessMedicine

#### 5. Producer:

McGraw Hill Medical

# 6. Years covered:

Unknown. Dates are not included in the filters or part of the information included for each search result, but the sources that I have viewed appear to be relatively recent from the past five years.

# 7. Would you recommend this database to a client who is working on your topic?

Although this database does provide some helpful resources about this topic, such as the resources I included for #8 below, I would not recommend this database to a client who is working on my topic. The main reason I would not recommend this database is that it is largely made with medical students and professionals in mind. This is noticeable in the options available

with in the filters that are used (format, select textbook, and topics). Under the "topics" filter, some of the terms used appear to be terms that medical professionals would understand more than a regular person searching for information on this topic. An example is the term "diabetes mellitus." Also, this issue with terms that may be hard for an average user to understand continues in the titles of many of the available resources. The search results also do not give the searcher a ton of information about the resource. The searcher is only given the title, the format, and the source of where it is from, which is not very helpful or informative. To find out more about each source, the client would have to click each individual source and read more about it, which can be time consuming. All in all, I would not recommend this database to a client because it is made for medical students and professionals and it is a bit inconvenient.

#### 6. Years covered:

1900 to present.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. The first reason is that there are plenty of available resources to use in this database. Specifically, just searching "birth control" led to 2,779 results. Another reason is that this database seems to have a thesaurus of some kind for search terms since it appears that "birth control" also pulled up results for "contraceptive" and "family planning." This feature may help users save time instead of having

to plug in a lot of other synonyms themselves in order to find as much information as they can on their topic. One more reason I would recommend this database is the quality of its filtering and sort by options; I find them to be quite extensive. First, I will discuss the offered filtering options. The list of these filter options is quite long; it includes quick filters (i.e., highly cited papers, open access, enriched cited references), citation topics meso, citation topics micro, authors, publication years, document types, Web of Science categories, affiliations, publication titles, publishers, funding agencies, languages, and many more! Since there are so many options to choose from the person searching for information has the chance to make their search as broad or narrow as they would like. Now, I will discuss the sort by options. This list is also long; it includes relevance, recently added, citation class, date, citations, usage, conference title, first author name, and publication title. Each sort by option has A to Z, Z to A, oldest to newest, or newest to oldest options when applicable to its category. These sort by options would allow the person search to view the results in a variety of ways. Another cool feature of this database that improves my opinion of it is the "Related Records" feature. On each search result, there is a "Related Records" button that when clicked will lead you to a list of records that is ranked according to the number of references they share with the parent record (the original search result that they clicked on). All in all, I would recommend this database because the search features are extensive and helpful and there are plenty of resources available on the topic of birth control.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. One reason that I would recommend this database is that there are thousands of sources available on this topic within this database. Another reason is the helpful features surrounding search present in this database. One of these helpful features is the search history being present at the top of the screen; it saves each search you make and any filters that you add to refine the search. Another helpful

feature is that each search result has an "Abstract" button that when clicked leads to a pop-up that has the abstract of the article. One last helpful feature that I want to mention for this database is the "Similar Records" button available on each search result; it makes a list of sources that are related to the original record that you clicked. This is similar to the "Related Records" button that appeared in the last database that I analyzed (Web of Science: Science Citation Index Expanded). Although the filters are still helpful, most of them may be confusing for the average user. Some of the likely more confusing filters include drugs, diseases, drug trade names, drug manufacturers, device trade names, and device manufacturers. The helpful filters are relatively basic options, such as sources, publication types, and publication years. All in all, I would recommend this database to a client because, even though the filters are not all helpful, it has many sources on this topic and includes a few helpful features.

## 3. Title of thesaurus (or URL):

UNESCO (https://vocabularies.unesco.org/browser/thesaurus/en/page/concept1539)

## 4. Name of index/database:

Taylor & Francis Online | Informa Healthcare

# 5. Producer:

Informa UK Limited

# 6. Years covered:

Exact dates are unknown, but on the "About" page, it mentions having sources from over 200 years ago. The years covered in my search results are 1917 to present.

## 7. Would you recommend this database to a client who is working on your topic?

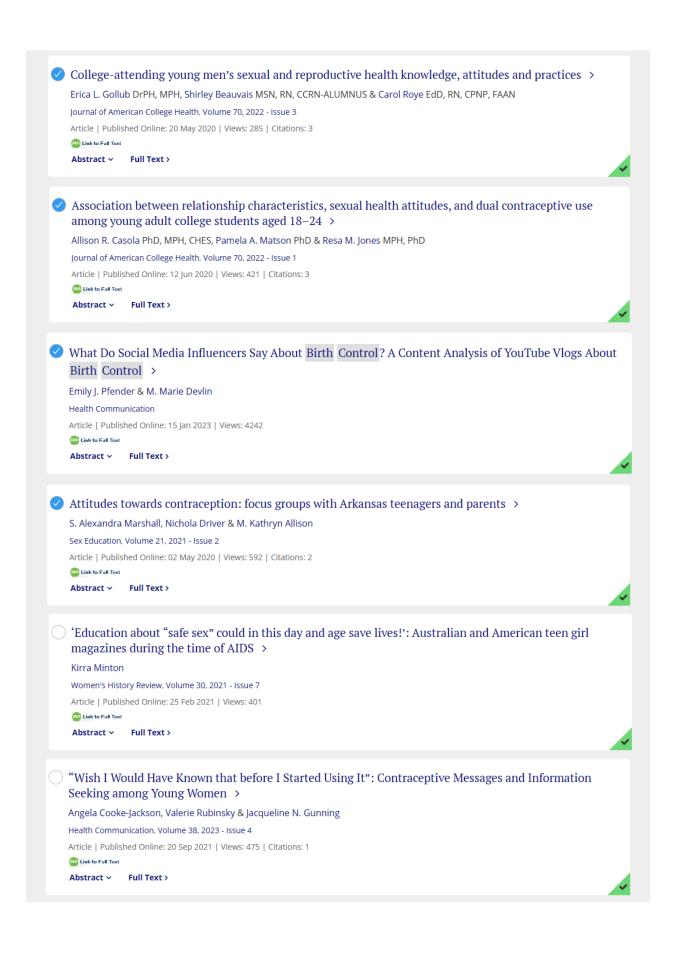

Yes, I would recommend this database to a client who is working on my topic. One reason that I would recommend this database is it provides a variety of articles from many different subject areas instead of simply being focused on the medical field. For instance, two of the selected articles for #8 below, describe how birth control is viewed on social media. Another reason that I

would recommend this database is the filters are still helpful even if they are not as extensive as some of the other databases that I have analyzed in this assignment. These filters include access type, subject, journal, and publication date. I find the access type filter to be extremely useful because its options are only show content I have full access to and only show Open Access; both of these options will ensure that the person searching is only viewing materials that they will be able to access, which is very useful and convenient. Some other features that might be helpful for a client searching for resources on this database are the "Abstract" button that leads to the abstract of the article and the "Most Read" and "Most Cited" options available to select for the sort order in this database. The feature that shows the abstract allows the searcher to get a better idea of what the article will be about. The "Most Read" and "Most Cited" sort order options allow the search to see what others are the most interested in or what others find to be informative and reliable. All in all, I would recommend this database because it has a variety of articles, the filters are helpful, and it has several features that would be helpful for someone looking for information on this database.

8. Insert here the screen capture from the database that includes bibliographic citations of relevant articles. I do not need the full text of the article! Place a page break after each search/finding. After the page break, please start the new database evaluation with number 1.

(The selected articles could not be viewed as citations or on one list together within the database, so below are my top 10 articles from two different filtered searches. The first filtered search was articles that I have full access to from 2019 to 2023 with the subject of "medicine, dentistry, nursing & allied health" selected. The first four articles are from this search, although they appeared in the next filtered search as well. The second filtered search was articles that I have full access to from 2019 to 2023 with no subject selected, in order to broaden the scope of the search. This filtered search helped me find the last six items in the list below.)

National Library of Medicine, U.S. Department of Health and Human Services

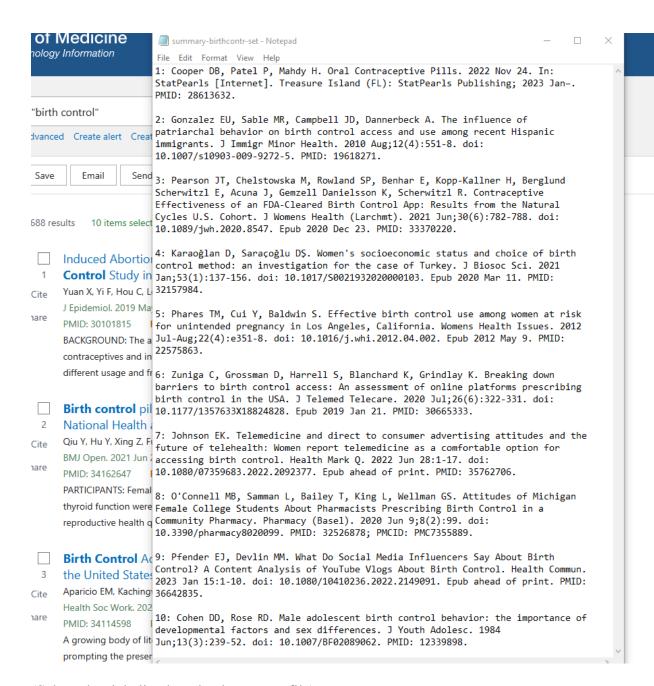

#### 6. Years covered:

Mainly 1966 to present. Sources have been selectively added from as far back as 1809. For instance, my search results cover from 1917 to present.

# 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. One reason I would recommend this database is the information available is reliable and includes a variety of articles from throughout the years, as far back as 1917, which allows the searcher to see how birth control has changed over the years. Another reason I would recommend this database is the

filters available are helpful, specifically text availability (abstract, free full text, full text) and publication date (1 year, 5 years, 10 years, custom range). The other filter options, such as article type and ages, seem to be more geared toward the medical profession, given the options to select from. For example, some of the options under the "article type" are clinical trial protocol, pragmatic clinical trial, and Research Support, American Recovery and Reinvestment Act. One more reason I would recommend this database is that the search results display a snippet of the abstract if one is available for the source.

# 7. Would you recommend this database to a client who is working on your topic?

No, I would not recommend this database to a client who is working on my topic. This database is dedicated to giving access to reports, data, and analyses of the National Institute of Health, which includes information about the National Institute of Health's expenditures and their reported research results. So, unless the client is specifically looking for this type of information, this database is not very helpful. There are not a lot of sources easily found on birth control. A

lot of the titles of publications and other documents involved specific medicine terms and names, so it would be difficult for most people to understand what these sources are about, which is not helpful and can be very intimidating. I was able to work with various synonyms and Boolean operators in order to find the articles for #8, but it was very difficult to find clearly related article on this topic. This database would be best used by people in or interested in the medical field who are able to understand the various terms and names referred to in this database. If these types of people worked with this database, they would enjoy the various filters include to minimize their search results and find what they are looking for. The filters include publication years, disclaimer, fiscal years, organization names, agencies, states, countries, and principal investigators. All in all, I would not recommend this database to an average client since it has hard to understand vocabulary and it is difficult to find sources on this topic.

8. Insert here the screen capture from the database that includes bibliographic citations of relevant articles. I do not need the full text of the article! Place a page break after each search/finding. After the page break, please start the new database evaluation with number 1.

(Could not select sources in this database and make a list, so I screenshot sources that I found individually.)

## 7. Would you recommend this database to a client who is working on your topic?

Yes, I would recommend this database to a client who is working on my topic. One reason I would recommend this database is that there is plenty of sources available about the topic of birth control. Without any filters applied to the search, it comes back with 11,268 documents. Another reason that I would recommend this database is the filters are very helpful to refining

the search and bringing back results that are more focused on the desired topic. These filters include year (range or individual), subject area, document type, language, keyword, country/territory, source type, source title, author name, publication stage, affiliation, funding sponsor, and open access. One feature that I like about the filters in this database is that you can choose to limit the results to only include selected filters or choose to exclude items that have those selected features. Other helpful features of this database that make me want to recommend it are the "Show Abstract" button, which causes the abstract to appear below the selected search result, the "Related documents" button, which leads to a list of documents that have similar references to the selected document, and lastly, the display features, such as sort order (date, cited by, relevance, first author, and source title) and view of results (table view or list view). All these features would be helpful for a person searching for information on a topic since it allows them to view source information in various ways, which might help them see important information that they did not notice before, and it helps save them time by bring the abstract and related items directly to them. All in all, I would recommend this database because it has plenty of sources, the filters are helpful, and it has several useful features.

Preferred Term

• Birth control

**Broader Concepts** 

• Family planning

Narrower Concepts

- Abortion
- Contraception

**Related Concepts** 

- Birth rate
- Fertility
- Overpopulation
- Population education
- Pregnancy
- Sexual behaviour

## 3. Title of thesaurus (or URL):

UNESCO (https://vocabularies.unesco.org/browser/thesaurus/en/page/concept1539)

## 4. Name of index/database:

Trip Medical Database (Free version)

## 5. Producer:

Trip Database Ltd.

## 6. Years covered:

The years covered are not stated directly on their "About" page. However, in <u>a blog</u> dedicated to the database, a post states that the bulk of the sources found on the database are 2000 to present, with the exception of some systematic reviews and RCTs that date back to the 1950s. Trip Medical Database was launched in 1997.

# 7. Would you recommend this database to a client who is working on your topic?

No, I would not recommend this database to a client who is working on my topic. At least I would not recommend this database to an average person, but it would likely be helpful to a client in the medical field. The first reason is many of the titles use medical terms and names, similarly to Scopus, but not as much. An average user would find it hard to find information since they are unfamiliar with such terms. The second reason is the filter options can be intimidating and possibly confusing. The options are very specific; some examples include controlled trials, regulatory guidelines, evidence-based synopses, and key primary research. These filters seem to be more geared toward medical professionals. The last reason I would not recommend this database is most of the helpful features (advanced search and more filtering options) and a lot of the articles (100,000+) are behind a paywall. All in all, I would not recommend this database to an average client because it seems to be geared toward medical professionals and many features and articles are behind a paywall. However, I would consider recommending it to a client if they were in the medical field.

8. Insert here the screen capture from the database that includes bibliographic citations of relevant articles. I do not need the full text of the article! Place a page break after each search/finding. After the page break, please start the new database evaluation with number 1.

(This database allowed you to bookmark articles, but it would not let you export the citations of the articles unless you paid for a Pro account. Since the bookmarked list only listed the titles of the articles, I went back and screenshot the basic information available in the search result entry: title, source type, publication year, and source of item.)

Patient-Centered Contraceptive Counseling

An interactive website to aid young women's choice of contraception: feasibility and efficacy RCT

Provision of the progestogen-only pill by community pharmacies as bridging contraception for women receiving emergency contraception: the Bridge-it RCT

<u>Giving the progestogen only pill along with emergency contraception encouraged women to use long-term contraception</u>

Birth Control

What Is Long-Acting Reversible Contraception?

Wishful thinking is not effective contraception: family planning, contraception, and safe prescribing.

Meeting the contraceptive needs of teens and young adults: youth-friendly and long-acting reversible contraceptive services in U.S. family planning facilities.

The state of hormonal contraception today: benefits and risks of hormonal contraceptives: combined estrogen and progestin contraceptives.

<u>Contraceptive choice: how do oral contraceptive users differ from condom users and women who use no contraception?</u>

# 7. Would you recommend this database to a client who is working on your topic?

No, I would not recommend this database to a client who is working on my topic, at least not unless that client worked in the medical profession. The main reason is the use of medical terminology and names, like Scopus and Trip Medical Database. An average client would be confused by the medical terms and names and find it difficult to find the information that they

desire. Another reason is the filters available in this database are not that extensive and use terms that are geared toward medical professionals. The filters include date range, related to, and advance search (suffixes, related terms, and headings only). The filter that seems to be made with medical professionals in mind is the "related to" filter. Some of the available options in this filter are indications, diagnosis, prognosis, and drug therapy. One last reason I would not recommend this database is the lack of information provided in the search result entries. As you can see in the screenshots from #8 below, the search result entries only had the title, a snapshot of where the keyword is in the source, and the main source of the entry. All in all, I would not recommend this database to an average client because it uses medical terminology, the filters are not very helpful, and the search result entries lacked valuable information.

8. Insert here the screen capture from the database that includes bibliographic citations of relevant articles. I do not need the full text of the article! Place a page break after each search/finding. After the page break, please start the new database evaluation with number 1.

(This database did not have an option to select or bookmark items to cite or save them, so I screenshot several sources from my search results.)
